1. Setup and Running

You can set up the program by navigating to the file in a unix based command line and typing "make intracoms". at this point, you can make the program with ./intracoms followed by a prime number (e.g. 3,5,7,11,13,17,23,27,31). If you would like to implement semaphore locking, after the prime number, have the second arg as "-lock" in order to set this up.

Unfortunately in this build, locking semaphores does not function.
